

Rubik Cube – Replace Graphics Documentation

Overview

This section explains how to replace existing graphics (e.g., cube face textures, UI buttons, icons, or other textures) in the Rubik Cube project without manually reassigning them inside Unity.

By following this method, your new graphics will automatically update in both the Scene and the Inspector, as long as the file name and folder location remain the same.

Step-by-Step Guide

1. Locate the Existing Image in Unity

- 1 Open your Unity project.
- 2 In the Project window, navigate to the folder containing your graphic asset.

Example path:

`Assets/RubikCube/Textures/`

Inside this folder, you'll find various texture files (e.g., CubeFace.png, PlayButton.png, Logo.png, etc.).

- 3 Right-click on the image you want to replace and select:
 “**Show in Explorer**” (Windows) or “**Reveal in Finder**” (Mac)

2. Prepare the New Image

- 1 Make sure your new image has the **same name** and **file format** as the existing one.

Example:

`Old image → CubeFace.png`

`New image → CubeFace.png (exact same name)`

- 2 Keep the image dimensions and type similar to the original (e.g., PNG format with transparency if the original is also PNG).

3. Replace the Image File

- 1 In the Explorer / Finder window, you'll see the existing image inside your Unity project's folder.

- ② Drag and drop or copy and paste your new image into the same folder.
- ③ When prompted with a message like:
 “This destination already has a file named ‘CubeFace.png’. Do you want to replace it?”
 Click **Replace the file**.

4. Automatic Update in Unity

- ① Return to the Unity Editor.
- ② Unity will automatically reimport the replaced image.

The new graphic will now appear everywhere the old one was used, including:

-  Scene objects (UI buttons, panels, cube faces)
-  Prefabs
-  Inspector references

✨ No additional manual assignment is required — as long as the file name and folder location remain unchanged.

5. Verify the Update

- ① Open the desired Scene (e.g., `RubikCubeScene.unity`).
- ② Check that the updated image appears correctly in the Game View and Inspector.
- ③ If it doesn’t update immediately:
 - Right-click inside the Project window → Select “**Reimport All**” to refresh all assets.

Example

If you want to replace a cube face texture:

- ① Locate the existing file:

`Assets/RubikCube/Textures/CubeFace.png`

- ② Right-click → **Show in Explorer**
- ③ Copy your new `CubeFace.png` file to that location
- ④ When prompted → Click **Replace**
- ⑤ Return to Unity — the cube face texture in the scene and prefabs will now display the new design automatically.

Tips

-  Always keep a backup of the original image before replacing it.
-  Maintain the same resolution or aspect ratio to prevent stretching or alignment issues.
-  If the new image doesn't appear correctly, check its **Import Settings** in the Inspector:
 - **Texture Type:** Sprite (2D and UI)
 - **Compression:** set appropriately for your platform

That's it!

You've successfully replaced graphics in your Rubik Cube project without manually reassigning any components.
